

1SP0335x2x1-5SNA0800J450300 and 1SP0335x2x1C-5SNA0800J450300 Data Sheet

Compact, high-performance, plug-and-play single-channel IGBT driver based on SCALE™-2 technology for individual and parallel-connected modules in 2-level, 3-level and multilevel converter topologies

Abstract

The SCALE™-2 plug-and-play driver 1SP0335x2x1-5SNA0800J450300 / 1SP0335x2x1C-5SNA0800J450300 (Coated version using ELPEGUARD SL 1307 FLZ/2 from Lackwerke Peters with a typical thickness of 50µm) is a compact single-channel intelligent gate driver designed for ABB's IGBTs 5SNA0800J450300. The master driver 1SP0335x2M1(C)-5SNA0800J450300 features a fiber-optic interface. It can be used as stand-alone driver or in conjunction with up to three 1SP0335D2S1(C)-5SNA0800J450300 slaves to drive up to four parallel-connected IGBT modules of type 5SNA0800J450300.

The DC/DC power supply must be purchased as a separate unit (one per master driver).

For drivers adapted to other types of high-power and high-voltage IGBT modules, refer to:

www.power.com/gate-driver/go/plug-and-play

Features

- ✓ Plug-and-play solution
- ✓ Allows parallel connection of IGBT modules
- ✓ For 2-level, 3-level and multilevel topologies
- ✓ Fiber-optic links (master)
- ✓ Built-in interface to 1SP0335D2S1 (slave)
- ✓ Duty cycle 0...100%
- ✓ Dynamic Advanced Active Clamping DA²C
- ✓ Dynamic IGBT short-circuit protection
- Monitoring of supply voltage
- Monitoring of gate voltage
- ✓ Extremely reliable; long service life
- ✓ Shortens application development time
- ✓ Suitable for 5SNA0800J450300

Applications

- ✓ Traction
- ✓ Railroad power supplies
- Light rail vehicles
- ✓ HVDC
- ✓ Flexible AC transmission systems (FACTS)
- ✓ Medium-voltage converters
- ✓ Industrial drives
- ✓ Wind-power converters
- Medical applications
- ✓ Research
- ✓ And many others

Safety Notice!

The data contained in this data sheet is intended exclusively for technically trained staff. Handling all high-voltage equipment involves risk to life. Strict compliance with the respective safety regulations is mandatory!

Any handling of electronic devices is subject to the general specifications for protecting electrostatic-sensitive devices according to international standard IEC 60747-1, Chapter IX or European standard EN 100015 (i.e. the workplace, tools, etc. must comply with these standards). Otherwise, this product may be damaged.

Important Product Documentation

This data sheet contains only product-specific data. For a detailed description, must-read application notes and common data that apply to the whole series, please refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" on www.power.com/gate-driver/go/1SP0335.

When applying SCALE-2 plug-and-play drivers, please note that these drivers are specifically adapted to a particular type of IGBT module. Therefore, the type designation of SCALE-2 plug-and-play drivers also includes the type designation of the corresponding IGBT module. These drivers are not valid for IGBT modules other than those specified. Incorrect use may result in failure.

Mechanical Dimensions

Dimensions: Refer to the relevant "Description and Application Manual"

Mounting principle: Connected to IGBT module with screws

Footnotes to the Key Data

- 1) The transceivers required on the host controller side are not supplied with the gate driver. It is recommended to use the same types as used in the gate driver. For product information refer to www.power.com/gate-driver/go/fiberoptics.
- 2) The recommended transmitter current at the host controller is 20mA. A higher current may increase jitter or delay at turn-off.
- 3) The typical transmitter current at the gate driver is 18mA. In case of supply undervoltage, the minimum transmitter current at the gate driver is 12mA: this is suitable for adequate plastic optical fibers with a length of up to 10 meters.
- 4) This refers to the manufacturer ordering number, see www.power.com/gate-driver/go/ext_erni. The customer-side connector as well as cables with different lengths can be supplied by Power Integrations. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" for more information.
- 5) This refers to the manufacturer ordering number, see www.power.com/gate-driver/go/ext erni. These connectors are to be used to connect 1SP0335x2M1(C) (master) or 1SP0335D2S1(C) (slave) to 1SP0335D2S1(C) (slave) if parallel connection of IGBT modules is required. Cables with different lengths can be supplied by Power Integrations. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" for more information.
- 6) If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload.
- 7) The given power can only be fully exploited without slaves 1SP0335D2S1(C) (no parallel connection of IGBT modules). If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload. From 70°C to 85°C, the maximum permissible output power can be linearly interpolated from the given data.
- 8) The given power can be fully exploited with slaves 1SP0335D2S1(C) (parallel connection of IGBT modules). If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload. From 70°C to 85°C, the maximum permissible output power can be linearly interpolated from the given data.
- 9) The gate current is limited by the gate resistors located on the driver.
- 10) This limit is due to active clamping under switching conditions. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers".
- 11) Due to the Dynamic Active Advanced Clamping Function (DA²C) implemented on the driver, the DC-link voltage can be increased in the off-state condition (e.g. after emergency shut-down). This value is only valid when the IGBTs are in the off state (not switching). The time during which the voltage can be applied should be limited to short periods (< 60 seconds). Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers".

SCALE™-2 1SP0335x2x1(C)-5SNA0800J450300

Data Sheet

- 12) The maximum dynamic voltage between auxiliary emitters of parallel-connected drivers due to asymmetrical operation at turn-on and turn-off must be limited to the given value.
- 13) Maximum allowed rate of change of auxiliary emitter voltage of parallel connected drivers.
- 14) Dynamic voltages between auxiliary emitters of parallel connected drivers at turn-on and turn-off lead to equalizing currents over the X2 or X3 bus. The peak and RMS values of the resulting current must be limited to the given value.
- 15) Undervoltage monitoring of the secondary-side supply voltage (Viso to Vee and Vee to COM which correspond with the approximate turn-on and turn-off gate-emitter voltages). If the corresponding voltage drops below this limit on 1SP0335x2M1(C) (masters), all paralleled IGBTs (master and slaves) are switched off and a fault is transmitted to the status output. If the corresponding voltage drops below this limit on 1SP0335D2S1(C) (slaves), the corresponding IGBT is switched off. If the IGBT was turned on, a fault will be generated by the gate-monitoring function on the master which will turn off all paralleled IGBTs after the corresponding delay.
- The mean value V_{GE,mean} of all gate voltages (master and all slaves) is filtered and compared to the given values at turn-on and turn-off. If the specified values are exceeded (V_{GE,mean} < V_{GE,on,min} at turn-on resp. V_{GE,mean} > V_{GE,off,max} at turn-off) after the given filter delay, the driver turns off all parallel-connected IGBTs and a fault is transmitted to the status output.
- 17) A dynamic Vce protection is implemented on the driver. The maximum allowed Vce voltage at turn-on is dynamically adjusted in order to better fit to the IGBT characteristics at turn-on. At the end of the turn-on process the given static value applies.
- 18) The resulting pulse width of the direct output of the gate drive unit for short-circuit type I (excluding the delay of the gate resistors) is the sum of the response time plus the delay to IGBT turn-off.
- 19) The turn-off event of the IGBT is delayed by the specified time after the response time.
- 20) Including the delay of the external fiber-optic links (cable length: 1m). Measured from the transition of the turn-on or turn-off command at the optical transmitter on the host controller side to the direct output of the gate drive unit (excluding the delay of the gate resistors).
- 21) Output rise and fall times are measured between 10% and 90% of the nominal output swing. The values are given for the driver side of the gate resistors with $2\Omega/1$ uF load. The time constant of the output load in conjunction with the present gate resistors leads to an additional delay at their load side.
- 22) Delay of external fiber-optic links. Measured from the driver secondary side (ASIC output) to the optical receiver on the host controller (cable length: 1m).
- 23) Measured on the host side. The fault status on the secondary side is automatically reset after the specified time.
- 24) Including the delay of the external fiber-optic links (cable length: 1m). Measured from the transition of the turn-on or turn-off command at the optical transmitter on the host controller side to the transition of the acknowledge signal at the optical receiver on the host controller side.
- 25) The gate resistors can be leaded or surface mounted. Power Integrations reserves the right to determine which type will be used. Typically, higher quantities will be produced with SMD resistors and small quantities with leaded resistors.
- 26) The driver supply voltage VDC is split into two distinct voltages on the driver. The first one is the turn-on voltage which is regulated at about 15V. The difference between VDC and the turn-on voltage is the turn-off voltage which is not regulated and mainly dependent on the driver input voltage VDC.
- 27) The fault status is set as long as the gate monitoring fault is present. The given value applies if the driver goes from the "off state" to the "on state" and the gate-emitter voltage of one or more parallel connected drivers does not turn on. If the driver goes from the "on state" to the "off state" and the gate-emitter voltage of one or more parallel connected drivers does not turn off, the fault status is applied as long as the gate monitoring fault is present.
- 28) The storage temperature inside the original package (1) or in case the coating material of coated products may touch external parts (2) must be limited to the given value. Otherwise, it is limited to 90°C.
- 29) The component surface temperature, which may strongly vary depending on the operating condition, must be limited to the given value for coated driver versions to ensure long-term reliability of the coating material.
