High-Voltage Insulated DC/DC Power Supply ISO3116I

for gate drivers for 4.5kV and 6.5kV IGBTs

The ISO3116I is a single-channel insulated DC/DC converter suitable as a power supply for IGBT drivers up to 6.5kV. Its output power of 3W enables switching frequencies up to 5kHz for 6.5kV/600A IGBTs. The ISO3116I complements the 1SD210F2 and 1SD312F2 SCALE high-voltage IGBT drivers.

Footnotes to the key data

1) The output voltage is not regulated and tracks the input voltage. The typical output voltage is 16.4V for an input voltage of 15V and a load current of 160mA. Input voltages higher than those specified can lead to destruction of the DC/DC converter or the gate driver.

2) Distance between input and output or between input or output and the mounting plane.

3) Values are valid for the full operating temperature range. The output voltage decreases with increasing load current. The DC/DC converter is not protected against overload.

4) Under-voltage monitoring of the input voltage. For a voltage lower than this limit, the DC/DC converter is switched off.

5) Maximum continuous or repeatedly applied DC voltage or peak value of the repeatedly applied AC voltage between input and output or between input or output and the mounting plane.

6) Refers to the static case with a maximum load current (250mA). The input current increases with decreasing temperature. The maximum value refers to an operating temperature of -40°C.

7) Application-specific self-heating is approx. 5°C for a load current of 190mA (corresponds to 3W). Nevertheless, it is recommended to check the operating temperature within the system.

8) For an output current in the range of 80mA to 250mA. (For SCALE high-voltage IGBT drivers 1SD210F2 and 1SD312F2, the standby supply current is 80mA.)

9) Refers to the static case without load. The input current increases with decreasing temperature. The maximum value refers to an operating temperature of -40°C.

10) The dielectric test voltage may be applied only once during one minute. It should be noted that with this (strictly speaking obsolete) test method, some (minor) damage occurs to the insulation layers due to the partial discharge. Consequently, this test is not performed at CONCEPT as a series test. In the case of repeated insulation tests (e.g. module test, equipment test, system test), the subsequent tests should be performed with a lower test voltage: the test voltage is reduced by 10% for each additional test. The more modern if more elaborate partial-discharge measurement is better suited than such test methods as it is almost entirely non-destructive.
